

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (original) A requirements management database system for data associated with a production lifecycle comprising:
- means for storing a first set of data elements representing a first set of requirements;
 - means for storing a second set of data elements representing a second set of requirements;
 - means for storing a third set of data elements representing a functional design specification;
 - means for assigning a unique identifier to each data element of each of said first, second and third sets of data elements;
 - means for establishing a set of links arranged to directly associate identifiers of data elements from said first set and to directly associate identifiers of data elements from said second set with identifiers of data elements from said third set.

2. (currently amended) A requirement management database system according to Claim 1 further comprising means for storing a set of said identifiers assigned to elements of said third ~~sets~~set;

means for establishing a set of links arranged to directly associate said set of identifiers with the corresponding identifiers of said ~~third set~~ first and second sets.

3. (currently amended) A requirement management database system according to claim 1 in which said means for assigning identifiers assigns identifiers comprising:

a first part identifying the set of elements to which the identifier is assigned;

a second part identifying the data element to which the identifier is assigned within the set of elements; and

a third part indicating the type of data element to which the identifier is assigned.

B12 4. (previously amended) A requirements management database system according to claim 1 in which the means for establishing a set of links is operable to establish a further set of links to associate identifiers of data elements from a further set with data elements from said third set.

5. (previously amended) A requirements management database system according to claim 1 further comprising means for associating one or more attributes such as a compliance attribute to one or more of said links.

6. (previously amended) A requirements management database system according to claim 1 further comprising a graphical user interface comprising:

a first means for displaying data elements;

a second means for displaying the identifier associated with the data element displayed by the first means;

a third means for displaying associated identifiers;

and wherein the user interface is operable, in response to an input command, to cause the second means to display the data element associated with an identifier displayed by the third means.

7. (original) A method of processing data in a database system for data associated with a production lifecycle comprising the steps of:

storing a first set of data elements representing a first set of requirements;

storing a second set of data elements representing a second set of requirements;

storing a third set of data elements representing a functional design specification;

assigning a unique identifier to each data element of each of said first, second and third sets of data elements;

establishing a set of links arranged to directly associate identifiers of data elements from said first set and to directly associate identifiers of data elements from said second set with identifiers of data elements from said third set.

8. (currently amended) A method of processing data in a database system according to Claim 7 further comprising the steps of:

storing a set of said identifiers assigned to elements of said third ~~sets~~ set;

establishing a set of links arranged to directly associate said set of identifiers with the corresponding identifiers of said ~~third set~~ first and second sets.

9. (currently amended) A method of processing data in a database system according to claim 7 wherein in said assigning step identifiers are assigned identifiers comprising:

a first part identifying the set of elements to which the identifier is assigned;

312 a second part identifying the data element to which the identifier is assigned within the set of elements; and

a third part indicating the type of data element to which the identifier is assigned.

10. (previously amended) A method of processing data in a database system according to claim 7 further comprising the step of establishing a further set of links to associate identifiers of data elements from a further set with data elements from said third set.

11. (previously amended) A method of processing data in a database system according to claim 7 further comprising the step of associating one or more attributes such as a compliance attribute, to one or more of said links.

12. (previously amended) A method of processing data in a database system according to claim 7 further comprising the steps of:

displaying data elements in a first area;

displaying, in a second area, the identifier associated with the data element displayed in the first area;

displaying associated identifiers in a third area;

and, in response to an input command, displaying in the second area the data element associated with an identifier displayed in the third area.
